Chapter #1:

How Machine Learning Works?

Deterministic Algorithm

A <u>deterministic</u> algorithm means that given a particular input, the algorithm will always produce the same output:

```
String sayHello(int hours, int minutes) {
  if (hours > 4 && hours < 12) {
    return "Good morning!";
  } else if (hours > 12 && hours < 18) {
    return "Good afternoon!";
  } else if (hours > 18 && hours < 22) {
    return "Good evening!";
  }
  return "Good night!";
}</pre>
```

The behavior of the sayHello() function is defined upfront by its creator.

Training a Model

"The process of training an ML model involves providing a learning algorithm with training data. The algorithm finds patterns in the training data that map the input data attributes to the target attributes, and it outputs an ML model that captures these patterns." (c) Amazon

```
8:35 Good morning!
8:40 Good morning!
10:00 How are you?
11:55 Good afternoon!
13:18 Good day!
14:50 Good afternoon!
15:22 Good afternoon, Sir!
17:14 Good evening!
...
22:34 Evening!
23:50 Good night!
```

```
f: H \times M \rightarrow G H = \{0, 1, 2, \dots, 23\} M = \{0, 1, 2, \dots, 59\} G = \{\text{"Good morning!"}, \text{"Good afternoon!"}, \text{"Good evening!"}, \text{"Good night!"}\}
```

Embedding

"An embedding is a relatively low-dimensional space into which you can translate high-dimensional vectors." (c) Google

Features:		Embeddings:	Vectors:
8:35	Good morning!	(8, 30, "morning")	(8, 30, 0)
8:40	Good morning!	(8, 45, "morning")	(8, 45, 0)
10:00	How are you?	NIL	
11:55	Good afternoon!	(12, 00, "morning")	(12, 00, 0)
13:18	Good day!	NIL	
14:50	Good afternoon!	(14, 45, "afternoon")	(14, 45, 1)
15:22	Good afternoon, Sir!	(15, 30, "afternoon")	(15, 30, 1)
17:14	Good evening!	(17, 00, "evening")	(17, 00, 2)
22:34	Evening!	(22, 30, "evening")	(22, 30, 2)
23:50	Good night!	(23, 45, "night")	(23, 45, 3)

Data Science

There are five tasks to complete repeatedly:

- 1. Collect and clean a dataset
- 2. Define features + embeddings
- 3. Choose and tune an algorithm
- 4. Train a Model
- 5. Validate the Model

Auto Code Completion

This is how <u>Copilot</u> by GitHub is suggesting code completion in our own programming language, which he definitely hasn't seen before:

```
81  # Converts this to hash
82  | > as-hash
83  | reduced. > @
84  | list
85  | bytes-as-array ^ 1
86  | 1
87  | [a b]
88  | plus. > @
89  | times.
90  | 31  | a
92  | as-int.
93  | (0.as-bytes.and b).right 54
```

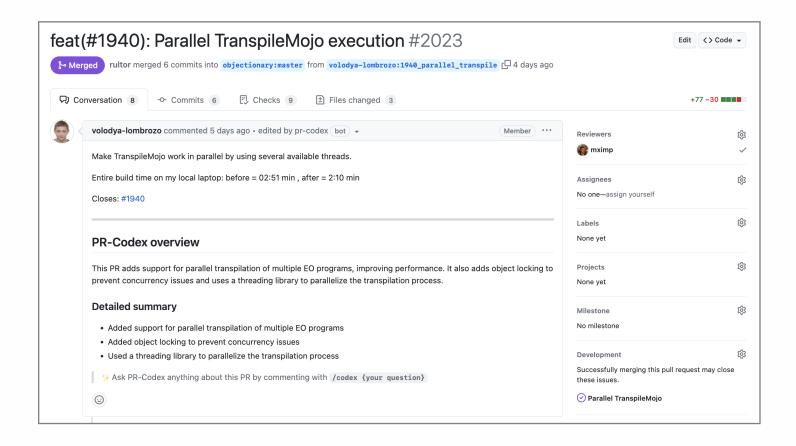

Read also about <u>AWS CodeWhisperer</u> at <u>Werner Vogels' blog</u>. Also, about <u>TabNine</u> (used to be Codota).

Repeat After Me!

Read about "making repeated edits easier with IntelliCode suggestions", by Peter Groenewegen.

Test Case Generation

Ponicode was alive in 2022, now it's dead acquired by CircleCI.

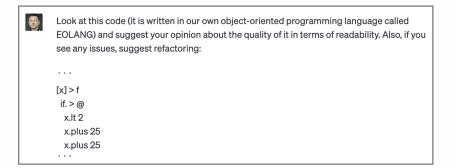

Automated Refactoring

I found this picture in the CodeScene website.

[Complete PR Review Risks Explain Repeat Tests Refactor LLM]

Large Language Models (LLM)

Based on the code snippet provided, it seems to define a function called ` ${f f}$ ` that takes an argument 'x', and applies some logic to it based on a conditional statement. In terms of readability, there are some aspects of the code that could be improved: 1. The use of `>` to indicate the start of the function definition may be confusing to someone who is not familiar with EOLANG. It might be better to use a more descriptive keyword like `function` instead. 2. The use of `if.` and 'e' may be confusing to someone not familiar with EOLANG. It's not immediately clear what these symbols mean. 3. The lack of indentation makes it harder to see which statements are part of the conditional block and which are not. 4. The repeated use of `x.plus 25` could be simplified by combining them into a single Here is a refactored version of the code that addresses these issues: javascript Copy code function f(x)if x.lt(2) { x.plus(50)In this version, I have used the 'function' keyword to define the function, and 'if' to define the conditional statement. I have also used curly braces to indicate the start and end of the conditional block, which makes it easier to see which statements are part of the block. Finally, I have combined the two `x.plus(25)` statements into a single `x.plus(50)` statement.
